# 5V/3.4A Dual Cell Battery Power Manager

#### **FEATURES**

- Dedicated Single-chip Integrated Battery Power Manager
- Dual Cell Battery Charger with Cell Balancing Management
- Auto Detection support USB BC1.2, Chinese YD/T 1591-2009, Apple 2.4A, and Samsung Devices
- Passed Apple MFi Test
- 4.5V-5.5V Input Voltage with 3.8A Input Current Limit
- 2.4A+1.0A Dual Outputs with CC Regulation
- 5.07V+/-1% Output with Prioritized Power Path from Input to Output
- 4.2V/4.35V +/- 0.5% Battery Charge Voltage Accuracy of Each Cell
- Output Plug-in Detection Wakeup and No Load Detection Sleep Mode
- Optimized Power Path and Battery Charge Control
- <10uA Low Battery Drainage Current</li>
- I2C Port for Optimal System Performance and Status Reporting
- Configurable Charge, Discharge and HZ modes
- >92% Charge and Discharge Efficiency at 3.4A Output for Full Battery Range
- 4 Modes of LED Operation
- Capability to Charge Wearable Devices
- Weak Input Sources Accommodation
- Safety:
  - Input Over-voltage Protection
  - Nearly Zero Power Short Circuit Protection
  - Output Over-voltage Protection

- Battery Over-charge and Over-discharge Protections
- Charge/Discharge Thermal Regulation
- TQFN5x5-40 Package

#### **APPLICATIONS**

- Backup Battery Pack
- Power Bank
- Dual Cell Boost Battery Charger
- Bluetooth Speaker
- Standalone Battery Charger with USB Output

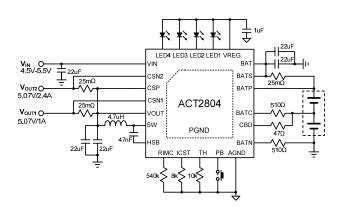

#### **GENERAL DESCRIPTION**

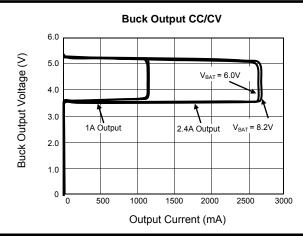

ACT2804 is a space-saving and dedicated single-chip solution for dual-cell battery charge and discharge. It takes 5V USB input source to charge a dual cell battery with boost configuration in three phases: preconditioning, constant current, and constant voltage. Charge is terminated when the current reaches 10% of the fast charge rate. The battery charger is thermally regulated at 110°C with charge current foldback.

If input 5V is not present, ACT2804 discharge a dual cell battery with buck configuration to provide 5.07V+/-1% to output ports. There is a power path from input to output. The cycle-by-cycle peak current mode control, constant current regulation, short circuit protection and over voltage protection maximize safe operation.

ACT2804 provides 4 LED drive pins for battery capacity level and charge status indication to indicate 25%, 50%, 75%, and 75% above battery level with battery impedance compensation. The LED indication patterns are programmable .

ACT2804 is available in a thermally enhanced 5mmx5mm QFN55-40 package with exposed pad.

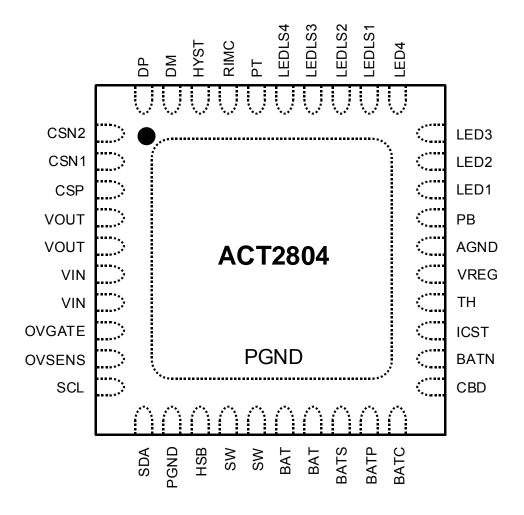

### ORDERING INFORMATION

	PART NUMBER	BATTERY CELL VOLTAGE	JUNCTION TEMPERATURE	PACKAGE	PINS
Ī	ACT2804QJ-T 4.20V		-40°C to 150°C	QFN55-40	40
Ī	ACT2804QJ-T0435 4.35V		-40°C to 150°C	QFN55-40	40

### **PIN CONFIGURATION**

**TOP VIEW** 

# **PIN DESCRIPTIONS**

PIN	NAME	DESCRIPTION
1	CSN2	Output current sense negative input for channel 2.
2	CSN1	Output current sense negative input for channel 1.
3	CSP	Output current sense positive input.
4, 5	VOUT	Power Output Pin.
6, 7	VIN	USB or AC Adapter input.
8	OVGATE	Output to drive optional external NMOS protect IC from over voltage.
9	OVSENS	USB or AC Adapter input sense.
10	SCL	I2C clock input.
11	SDA	I2C data input.
12	PGND	Power ground. Directly connect this pin to IC thermal PAD and connect 10uF or 22uF high quality capacitors from BAT to PGND on the same layer with IC.
13	HSB	High side bias pin. Connect a 47nF ceramic capacitor from HSB to SW.
14,15	SW	Internal switch connected to a terminal of the output inductor.
16,17	BAT	BAT connection. Connect it to battery current sense positive terminal. Bypass BAT pin to PGND pin with high quality ceramic capacitors on the same layer with IC.
18	BATS	Battery charge current sense input. Connect to charge sense resistor positive terminal with Kevin sense.
19	BATP	Connect to charge sense resistor negative terminal and battery positive terminal.
20	BATC	Battery central point connection. Connect to dual battery cell common terminal.
21	CBD	Cell balancing discharge. Connect to a discharge resistor from this pin to battery common terminal.
22	BATN	Battery negative terminal.
23 ICST current. The current setting rai		Fast charge current setting pin. Connect a resistor from this pin to AGND to set the charging current. The current setting ranges from 0.5A-1.8A. The voltage at this pin reflects the charge current and discharge current in charge mode and discharge mode, respectively.
24	TH	Temperature sensing input. Connect to a battery thermistor terminal.
25	VREG	+5V Bias output. Connect a 1.0uF to this pin. This pin supplies up to 50mA output current. The bias turns on in charge mode and discharge mode. Internal register bit can shut down the bias. Bias turns off in HZ mode.

# **PIN DESCRIPTIONS**

PIN	NAME	DESCRIPTION
26	AGND	Logic ground output. Connect this pin to the exposed PGND pad on same layer with IC.
27	РВ	Push button input. When this pin is pushed for more than 40ms, LED1-4 indicators are enabled for 5 seconds.
28	LED1	Battery level indicator.
29	LED2	Battery level indicator.
30	LED3	Battery level indicator.
31	LED4	Battery level indicator.
32	LEDLS1	LED1 threshold level shift. Connect a resistor from the pin to AGND to shift LED1 threshold.
33	LEDLS2	LED2 threshold level shift. Connect a resistor from the pin to AGND to shift LED2 threshold.
34	LEDLS3	LED3 threshold level shift. Connect a resistor from the pin to AGND to shift LED3 threshold.
35	LEDLS4	LED4 threshold level shift. Connect a resistor from the pin to AGND to shift LED4 threshold.
36	PT	LED indication mode input. The 5 modes of LED indication patterns are set by a voltage at this pin. Connect a resistor at the pin to set the voltage and an LED indication pattern.
37	RIMC	RIMC Battery impedance compensation input.
38	HYST	The hysteresis window setting input. Connect a resistor at the pin to set the hysteresis windows for LED1, 2, 3, 4.
39	DM	Output port auto detection input. Connected to portable device D
40	DP	Output port auto detection input. Connected to portable device D+.
41	PGND	Exposed pad. Must be soldered to ground plane layer(s) on the PCB for best electrical and thermal conductivity.

# **ABSOLUTE MAXIMUM RATINGS®**

PARAMETER	VALUE	UNIT
LEDLS1, LEDLS2, LEDLS3, LEDLS4, RIMC, HYST and PT to GND	-0.3 to +6	V
LED1, LED2, LED3 and LED4 to GND	-0.3 to +6	V
PB, DM, DP, TH, SCL, SDA and ICST to GND	-0.3 to +6	V
OVSENS to GND	-0.3 to +16	V
OVGATE to GND	-0.3 to +12	V
VIN, VOUT and VREG to GND	-0.3 to +6	V
CSP to CSN2, CSP to CSN1, CSP to VOUT	-0.3 to +0.3	V
BAT to BATS, BATS to BATP	-0.3 to +0.3	V
BATC to BATN	-0.3 to +6	V
BAT to BATC	-0.3 to +6	V
BATN to GND	-0.3 to +0.3	V
CBD to BAT	-6 to +0.3	V
BATN to CBD	-6 to +0.3	V
SW to PGND	-0.3 to +12	V
HSB to SW	-0.3 to +6	V
Junction to Ambient Thermal Resistance (θ <sub>JA</sub> )	40	°C/W
Operating Junction Temperature (T <sub>J</sub> )	-40 to 150	$^{\circ}$ C
Operating Temperature Range (T <sub>A</sub> )	-40 to 85	$^{\circ}\!$
Store Temperature	-55 to 150	$^{\circ}$
Lead Temperature (Soldering, 10 sec)	300	$^{\circ}\!\mathbb{C}$

Do not exceed these limits to prevent damage to the device. Exposure to absolute maximum rating conditions for long periods may affect device reliability.

#### **FUNCTIONAL DESCRIPTION**

ACT2804 is a complete battery charging and discharging power management solution for applications of dull-cell lithium-based backup battery pack or power bank.

With the advanced bidirectional architecture, a synchronous boost/buck converter is connected from VOUT to switching node (SW). The converter could be configured as either boost to charge battery or buck to discharge battery.

#### **Modes of Operation**

ACT2804 has 3 operation modes: charge mode, discharge mode, and high-impedance (HZ) mode.

#### High Impedance (HZ) Mode

HZ mode is the default mode. In HZ mode, all the switches are turned off, only PB circuit alive and the IC draws less than 10uA current from VBAT.

#### Discharge Mode

In discharge mode, Buck converter operates in CV/ CC regulation. VOUT1 current limit is set at 1.25A and VOUT2 current limit is set at 2.65A.

#### Charge Mode

ACT2804 is configured in charge mode (boost mode) when VIN is valid. In this mode, a battery is charged with trickle, preconditioning, fast charge, top-off and end of charge (EOC). The typical charge management is shown in Figure 1.

#### **Precondition Charge**

When operating in precondition state, the cell is charged at a reduced current at 15% of the programmed maximum fast charge constant current. Once V<sub>BAT</sub> reaches the precondition threshold voltage the state machine jumps to the fast charge state.

#### Fast Charge

battery voltage is above preconditioning threshold, boost converter charges battery with constant current. In fast charge state, the ACT2804 charges at the current set by the external resistor connected at the ICST pin. During a normal charge cycle fast charge continues in CC mode until V<sub>BAT</sub> reaches the charge termination voltage, at which point the ACT2804 charges in top off state.

#### Top Off

Device transitions from Fast Charge (CC) to Top Off (CV), and moves to EOC (End of Charge) state when charging current is less than I<sub>FOC</sub>.

#### End of Charge

In Top Off mode, when charges current decreases to 10% of set fast charge current, the boost converter goes into end of charge mode and keep monitoring the battery voltage.

#### Recharge

In EOC, device would re-charge batteries when both battery voltage levels drops 5% below V<sub>FOC</sub>.

#### **Battery Removal**

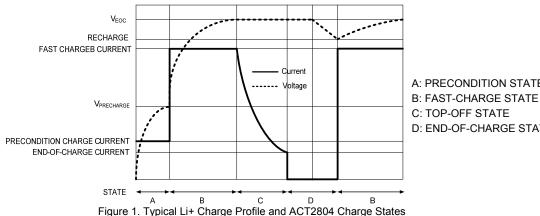

If the battery is removed, boost converter regulates at the programmed regulation voltage.

#### Cell Balance

Cell Balance is activated in both Fast Charge and Top Off modes. Each battery is connected with a parallel bleeding switch.

#### **Push Button**

PB is always watched in HZ mode and discharge mode. If the push but on PB is pressed for >40mS in HZ mode, the LED (s) will turn on for 5 seconds. In the mean time, discharge mode is enabled.

A: PRECONDITION STATE

C: TOP-OFF STATE

D: END-OF-CHARGE STATE

#### **APPLICATIONS INFORMATION**

#### **Fast Charge Current Control**

The block diagram in Figure 2 shows how battery current is sensed for charge current control.

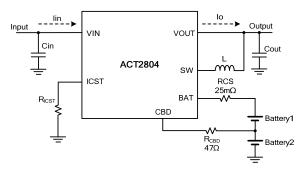

Figure 2: Battery current monitoring

A small percentage of charge current is sensed and sinked into a resistor connected at pin ICST. In charge mode, this would allow user to set fast charge current based on the following equation.

$$Ic(A) = \frac{1000}{5 * R_{CS}(m\Omega) * R_{ICST}(k\Omega)}$$
(1)

For example,  $I_{\text{C}}\text{=}1A$  with  $R_{\text{CS}}\text{=}25\text{m}\Omega$  and  $R_{\text{ICST}}\text{=}8k\Omega.$ 

Recommended RICST is shown in following table:

I (A)	R <sub>I</sub>	Units	
$I_{C}(A)$	$R_{CS}=25m\Omega$	$R_{CS}=50m\Omega$	Units
0.8	10	5	kΩ
0.9	8.89	4.44	kΩ
1.0	8	4	kΩ
1.1	7.27	3.64	kΩ
1.2	6.67	3.33	kΩ
1.3	6.15	3.08	kΩ
1.4	5.71	2.86	kΩ
1.5	5.33	2.67	kΩ

During discharge mode, inputs of battery current sense amp are flipped to sense discharge current, and voltage level at pin ICST can be used (by the system) to monitor the magnitude of discharge current based on the following equation.

$$V_{ICST} = \frac{I_{DISCHARGE} \times R_{ICST}}{20 k\Omega}$$
 (2)

For example:  $V_{\text{ICST}}$ =0.4V with I\_DISCHARGE=1A, and  $R_{\text{ICST}}$ =8k $\Omega$ .

#### **LED Threshold Setting**

LED1, LED2, LED3 and LED4 thresholds are adjustable with external resistors  $R_{LS1}$ ,  $R_{LS2}$ ,  $R_{LS3}$ ,

and  $R_{LS4}$  connected from LEDLS1, LEDLS2, LEDLS3, LEDLS4 to APNG respectively, as shows in Figure3.

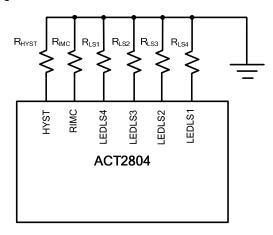

Figure 3: LED threshold setting

The following equation shows how the external resistor shifts the LED thresholds. The range of LED1 - LED4 indicator threshold shift from 5.5V - 8.8V

$$V_{LEDX (V)} = 5.5V + \frac{108 \,\mathrm{k}\Omega}{\mathrm{R}_{\mathrm{LSx}}(k\Omega)} \tag{3}$$

VLED Example is given by the below table:

$R_{LSx}$ $(k\Omega)$	V <sub>LEDx</sub> (V)	$R_{LSx}$ (k $\Omega$ )	V <sub>LEDx</sub> (V)
40	8.2	72	7
43.2	8	90	6.7
47	7.798	108	6.5
49.1	7.7	120	6.4
57	7.395	135	6.3
60	7.3	180	6.1
67.5	7.1	270	5.9

#### **LED Hysteresis Window Setting**

The adjustable LED voltage thresholds are set for HZ mode. In charge mode, the measured battery voltage is higher than in HZ mode, while in discharge mode, the measured battery voltage is lower. To have relatively better "fuel gauge" for battery, a programmable hysteresis window will help. When the battery voltage goes up (in charge mode), the thresholds become higher, when the battery voltage goes down, lower thresholds are applied.

ACT2804 provide HYST pin to set hysteresis window for each indication level as shows in Figure 3.

#### **APPLICATIONS INFORMATION**

HYST pin is regulated at 1V. Its input current will determine hysteresis adjustment equally to all level. Connect HYST to AGND via a resistor to set hysteresis window.

Beside the hysteresis window, to avoid comparison oscillation, fixed 100mV of hysteresis is added to each LEVEL comparator.

Hysteresis window is given by below equation:

$$HYST (V) = \frac{54K}{RHYST (K\Omega)}$$
 (4)

$$V_{HYST}\langle 4:3\rangle = 0.5*HYST$$
  $V_{HYST}\langle 2:1\rangle = 0.6*HYST$  (5)

Then RHYST Example is given by the below table:

$R_{HYST}(k\Omega)$	LED1 VHYST	LED2 VHYST	LED3 VHYST	LED4 VHYST
Floating	0mV	0mV	0mV	0mV
270	120mV	120mV	100mV	100mV
135	240mV	240mV	200mV	200mV
90	360mV	360mV	300mV	300mV
67.5	480mV	480mV	400mV	400mV
54	600mV	600mV	500mV	500mV
45	720mV	720mV	600mV	600mV

#### **Battery Impedance Compensation**

To avoid the number of LEDs changes between charge and discharge modes. Internal impedance compensation circuit is built in. An external resistor is used to set the impedance from  $100m\Omega$  to  $800m\Omega$ . RIMC is corresponding to battery impedance. The LED1-4 thresholds shifted up and down based on the product of charge/discharge current and set impedance. RIMC value is given by below equation.

$$R_{IMC}(k\Omega) = 2160 k\Omega \times \frac{R_{CS}(m\Omega)}{R_{BAT}(m\Omega)}$$
 (6)

In case not using compensation, float RIMC then there is no compensation affects to trig-points.

RIMC example is given by the below table:

RBAT (mΩ)	100	200	300	400	500	600	700
$RCS = 25 \text{ m}\Omega$	540k	270k	180k	135k	108k	90k	77k
$RCS = 50 \text{ m}\Omega$	1080k	540k	360k	270k	216k	180k	154k

#### **Battery Temperature Monitering**

The ACT2804 monitors the battery pack temperature by measuring TH voltage at the TH pin as shows in Figure 4. The TH pin is connected to the thermistor resistor net which includes a negative temperature coefficient thermistor. An internal current source provides a bias current to generate

TH voltage. The ACT2804 compares the voltage at the TH pin with the internal  $V_{THH}$  and  $V_{THL}$  thresholds to determine if charging or discharging is allowed. When  $V_{TH} < V_{THL}$  or  $V_{TH} > V_{THH}$ , it will be triggered latch off fault, there is 3 ways to wake up ACT2804 when  $V_{TH}$  returns to the normal range.

- I. Push PB when latch off bit is not set
- I<sup>2</sup>C to clear faults in standby
- 3. Plug Vin to power up

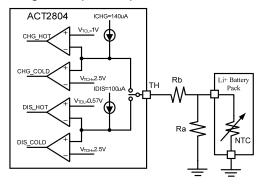

Figure 4: Thermistor setting

$$V_{TCL} = I_{CHG} \times Rchot \tag{7}$$

$$V_{TCH} = I_{CHG} \times Rcold \tag{8}$$

$$Rchot = Rb + \frac{Ra \times R_{NTCh}}{Ra + R_{NTCh}}$$
(9)

$$Rcold = Rb + \frac{Ra \times R_{NTCc}}{Ra + R_{NTCc}}$$
 (10)

R<sub>NTCc</sub>: NTC Resistor at cold temperature (Tcold)

 $R_{\text{NTCh}}$ : NTC Resistor at hot temperature (Thot)

From (7) (8) (9) and (10) calculate Ra and Rb in charge mode, as the same method, the resistors in discharge mode can be calculated.

#### **Cell Balance Setting**

ACT2804 has integrated a cell balance feature to reduce the un-balance charge between dual batteries. Normally cell balance is activated during Fast Charge and Top Off modes.

#### APPLICATIONS INFORMATION

In charge mode, the battery charger provides bias current to balance battery charge. The balance resistor is either connected to upper battery or lower battery depending on which battery voltage is higher. The balance resistor is connected in parallel with one battery that is higher than the other battery. For extremely unbalanced 2S batteries, the charger takes a few cycles to make two battery voltage balanced. For some applications, like removable dual cell batteries, a charger is required to balance dual cells in one charge cycle. In this case, the circuit shown in Figure 5 is recommended. The balance current through the 22 Ohm resistor needs to be higher than EOC current threshold.

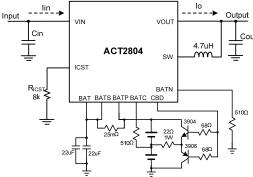

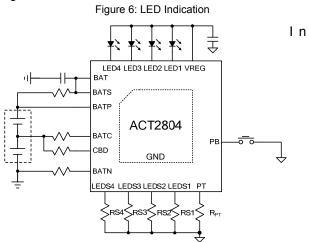

Figure 5: Cell balance

#### **LED Indication**

ACT2804 is designed 5 levels of PT pin voltage into 5 application patterns. A resistor is connected from PT pin to ground and the voltage at PT pin programs the LED indication patterns shown in Figure 6.

discharge mode, when battery voltage goes below LED1 threshold, LED1 starts flashing until Buck (discharge mode) turns off due to either light load or Buck UVLO. The flash frequencies for all the LEDs

are 0.5Hz with 1s on and 1s off.

In HZ mode, when PB is pressed for 40ms, Buck turns on. If VBAT<LED1, LED1 starts flashing until Buck turns off.

Conventional indication patterns could behave to have two application. Setting  $R_{\text{PT}}\text{=}4k\Omega$  to have "Always On", setting  $R_{\text{PT}}\text{=}12k\Omega$  to have "5s Indication". The behaviors for both setting are same in charge mode.

See below table for more information.

#	INDICATION PATTERN	$R_{PT}$
1a	Conventional Always On In Discharge	4kΩ
1b	Conventional 5s Indication in Discharge	12kΩ
2	Breathing 5s Indication in Discharge	24kΩ
3	Bottom Charging 5s Indication in Discharge	40kΩ
4	Circulating 5s Indication in Discharge	56kΩ

Below shows 4 LED indication patterns.

		Bottom		
	Conventional	Charging	Circulating	Breathing
<25%	$\otimes \otimes \otimes \otimes$	$\bigcirc \otimes \otimes \otimes$	0000	$\bigcirc \otimes \otimes \otimes$
25%≤SOC<50%		$00 \otimes \otimes$	0000	0088
50%≤SOC<75%	$\bigcirc\bigcirc\bigcirc$	0000	0000	0008
75%≤SOC<100%	0000	0000	0000	0000
EOC	0000	0000	0000	0000
	Flash	O Circ	culating on	Always on
	Breathing of	on/off $\bigotimes$ Off		

#### **LED1-4 Refreshing Cycle**

Every time when VIN is plugged in or a PB is pushed, LED1, 2, 3, 4 turns on sequentially at 0.5s interval, like a LED scanning, and then goes into corresponding mode defined by PT pin.

#### **LED1-4 Fault Alarm Signal**

At fault conditions, actions are taken. In the meantime, all the 4 LEDs turn on/off with 0.5s on and 0.5s off for 10 seconds to send alarm signal out. The fault conditions include battery OVP, UVP, OTP.

#### **PCB Board Lavout Guidance**

When laying out the printed circuit board, the following checklist should be used to ensure proper operation of the IC.

1. Arrange the power components to reduce the AC loop area.

Rev 3, Apr-17-2017

#### **APPLICATIONS INFORMATION**

- Place the decoupling ceramic capacitor as close to BAT pin as possible. Use different capacitance combination to get better EMI performance.
- 3. Place the decoupling ceramic capacitors close to VIN pin, VOUT pin, and BAT pin.
- 4. Use copper plane for power GND for best heat dissipation and noise immunity.
- Connect battery with the sequence of BATN->BATP->BATC.
- Use Kevin sense from sense resistors to CSP and CSN1, CSN2 pins, and the sense resistor from BATS and BATP pins.
- 7. SW pad is a noisy node switching. It should be isolated away from the rest of circuit for good EMI and low noise operation.
- Thermal pad is connected to GND layer through vias. PGND and AGND should be single-point connected.
- RC snubber and external Schottky diode across SW to PGND can be added as needed for reducing SW spike and better EMI performance.

### **APPLICATIONS SCHEMATIC**

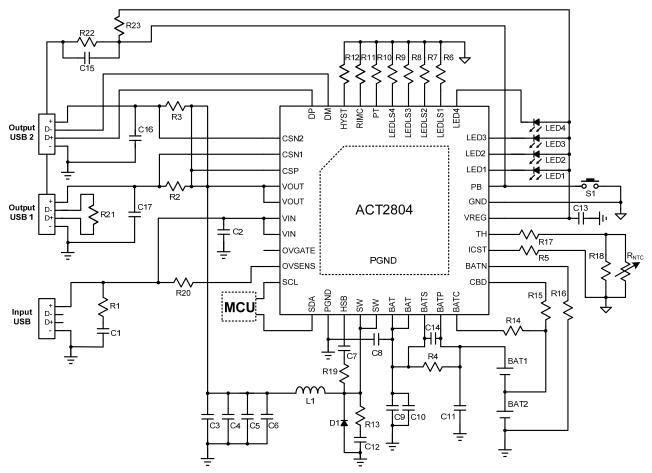

Figure 7. ACT2804 typical application circuit

(Input current limit 3.8A, fast charge current limit 1.0A, discharge output constant current 2.4A+1A) Charge: Cold: 0°C, Hot: 45°C. Discharge: Cold: -20°C, Hot: 60°C.
